Case study

Insurance Manager-Insurance Company Management System

Executive Summary

"SummationIT" has collaborated with a reputed Insurance company that has been catering needs of Insurance customers. They offer various Insurance products as per the need of the customers. They have made their mark since the last 20 years.

Business Requirement: Client is a reputed name in insurance sector in United States, has planned to implement a web application for their insurance agents and customers for a smooth process of transactions and updates. They already have a website and they were in need of a perfect web application which will have robust features. The web application should have features like Case Management, tracking of commission and premium amounts and policy advisor. They wanted it to be done in a cost effective way.

Our Solution: We have developed the web application using Zend framework (PHP) and MySQL as backend solution. Features such as Quick data access and communication management, reminders, scheduling systematic follow-ups, graphical visualization of the revenue and profits of an advisor were added after the initial delivery. This was possible because of the flexible design of the application.

Summation IT has successfully implemented and launched the application, we are currently working on providing Mobility Solutions for the same application. The application will soon be launched across various iOS and Android devices.
